Summary

Resolves, adds, and removes namespaces in a collection and provides scope management for these namespaces. This class is used by the `System.Xml.XmlReader` and `System.Xml.XmlTextReader` classes.

Inherits From: System.Object

Library: XML

Thread Safety: All public static members of this type are safe for multithreaded operations. No instance members are guaranteed to be thread safe.

Description

This class stores prefixes and namespaces as unique `System.String` objects.

`System.Xml.XmlNamespaceManager` assumes all prefixes and namespaces are valid.

If the prefix and namespace already exist within the current scope, they will replace the existing prefix/namespace combination. The same prefix and namespace combination can exist across different scopes.

The following prefix/namespace pairs are added by default to the `System.Xml.XmlNamespaceManager`. They can be determined at any scope.

Prefix	Namespace
xmlns	http://www.w3.org/2000/xmlns/ (the xmlns prefix namespace)
xml	http://www.w3.org/XML/1998/namespace (The XML namespace)
<code>System.String.Empty</code>	<code>System.String.Empty</code> . The empty namespace can be reassigned a different prefix. For example, <code>xmlns=""</code> defines the default namespace to be the empty namespace.

XmlNamespaceManager(System.Xml.XmlNameTable) Constructor

[ILAsm]  
public rtspecialname specialname instance void .ctor(class  
System.Xml.XmlNameTable nameTable)  
  
[C#]  
public XmlNamespaceManager(XmlNameTable nameTable)
```

Summary

Constructs and initializes a new instance of the `System.Xml.XmlNamespaceManager` class.

Parameters

Parameter	Description
<i>nameTable</i>	The <code>System.Xml.XmlNameTable</code> to use.

Description

[*Note: nameTable* is used to look up prefixes and namespaces.

]

Exceptions

Exception	Condition
<code>System.ArgumentNullException</code>	<i>nameTable</i> is null.

XmlNamespaceManager.AddNamespace(System.String, System.String) Method

```
[ILAsm]  
.method public hidebysig virtual void AddNamespace(string prefix, string uri)  
  
[C#]  
public virtual void AddNamespace(string prefix, string uri)
```

Summary

Adds the given namespace to the collection of namespaces maintained by the current instance in `System.Xml.XmlNamespaceManager.NameTable`.

Parameters

Parameter	Description
<i>prefix</i>	A <code>System.String</code> specifying the prefix to associate with the namespace being added. Use <code>System.String.Empty</code> to add a default namespace.
<i>uri</i>	A <code>System.String</code> specifying the namespace to add.

Description

[*Note:* The same prefix and namespace combination can exist across different scopes.
]

Behaviors

As described above.

Default

This method assumes all prefixes and namespaces are valid but does not check *prefix* and *uri* for conformance to the W3C specification.

If the specified prefix/namespace combination already exists within the current scope, their `System.String` instances will be replaced in

1 System.Xml.XmlNamespaceManager.NameTable with the new System.String instances
2 of *prefix* and *uri*.

3 **How and When to Override**

4 Override this method to check *prefix* and *uri* for conformance to the W3C specification.

5

6 **Exceptions**

7

8

Exception	Condition
System.ArgumentException	<i>prefix</i> is "xml" or "xmlns".
System.ArgumentNullException	<i>prefix</i> is null, or <i>uri</i> is null.

XmlNamespaceManager.GetEnumerator() Method

```
[ILAsm]  
.method public hidebysig virtual class System.Collections.IEnumerator  
GetEnumerator()  
  
[C#]  
public virtual IEnumerator GetEnumerator()
```

Summary

Provides support for iteration over the collection of namespaces maintained by the current instance.

Return Value

A System.Collections.IEnumerator.

Behaviors

As described above.

How and When to Override

Override this method to customize the behavior of this method in types derived from the System.Xml.XmlNamespaceManager class.

Usage

Use this method to iterate through the collection of namespaces in System.Xml.XmlNamespaceManager.NameTable.

XmlNamespaceManager.HasNamespace(System.String) Method

```
[ILAsm]  
.method public hidebysig virtual bool HasNamespace(string prefix)  
  
[C#]  
public virtual bool HasNamespace(string prefix)
```

Summary

Gets a value indicating whether the supplied prefix has a namespace defined for the current pushed scope.

Parameters

Parameter	Description
<i>prefix</i>	A System.String containing the prefix of the namespace to find.

Return Value

A System.Boolean where true indicates there is a namespace defined; otherwise, false. If *prefix* is null, returns false.

Behaviors

As described above.

Default

When *prefix* is set to System.String.Empty, this method returns true to indicate a default empty namespace is defined in the current scope.

How and When to Override

Override this method to customize the behavior of this method in types derived from the System.Xml.XmlNamespaceManager class.

2

XmlNamespaceManager.LookupNamespace(System.String) Method

```
[ILAsm]  
.method public hidebysig virtual string LookupNamespace(string prefix)  
  
[C#]  
public virtual string LookupNamespace(string prefix)
```

Summary

Gets the namespace URI associated with the specified prefix.

Parameters

Parameter	Description
<i>prefix</i>	A System.String containing the prefix whose namespace URI to resolve. To match the default namespace, pass System.String.Empty.

Return Value

A System.String containing the namespace URI for *prefix*, or null if there is no mapped namespace.

Behaviors

As described above.

How and When to Override

Override this method to customize the behavior of this method in types derived from the System.Xml.XmlNamespaceManager class.

XmlNamespaceManager.LookupPrefix(System.String) Method

```
[ILAsm]  
.method public hidebysig virtual string LookupPrefix(string uri)  
  
[C#]  
public virtual string LookupPrefix(string uri)
```

Summary

Gets the prefix associated with the given namespace URI.

Parameters

Parameter	Description
<i>uri</i>	A System.String containing the namespace to resolve for the prefix.

Return Value

A System.String containing the matching prefix. If there is no mapped prefix, this method returns null. If a null value is supplied, then null is returned.

Behaviors

As described above.

How and When to Override

Override this method to customize the behavior of this method in types derived from the System.Xml.XmlNamespaceManager class.

XmlNamespaceManager.PopScope() Method

```
[ILAsm]  
.method public hidebysig virtual bool PopScope()  
  
[C#]  
public virtual bool PopScope()
```

Summary

Pops a namespace scope off the stack.

Return Value

A `System.Boolean` where `true` indicates a namespace scope was popped off the stack; `false` indicates there were no namespaces scopes to pop.

Behaviors

As described above.

Default

This method removes all the namespaces that were added to the collection (by calling `System.Xml.XmlNamespaceManager.AddNamespace`) since the last call to the `System.Xml.XmlNamespaceManager.PopScope` method.
